

Product Name: TaskFlask
Team Name: The Goatz
Release Name: TaskFlask
Release Date: July 22, 2026
Revision Number: 2.0
Revision Date: July 3rd, 2026

High Level Goals

The goal of the release is to build a lightweight sprint tracking web application for student software engineering teams. Provide an easy way to manage projects, sprints, and tasks while delivering a simple, functional MVP.

The main goals are:

1. Having users being able to create, view, edit, and delete projects.
2. Having every project have multiple sprints.
3. Show progress for sprints using simple counts and having percent be complete.
4. Have users be able to create, view, edit, delete, assign tasks within a sprint.
5. Providing a sprint report for meetings.
6. Having the app be simple and local to make it easy for the whole team to be able to understand and also maintain.
7. Nothing including unnecessary features such as the user authentication.

User Stories Defining the Scope of the Release

Sprint 1

Goal: Build the project foundation and make the app runnable locally.

User Stories and Tasks:

- {High Priority} As a developer, I want to clone the repo, install dependencies, initialize the database, and run the app locally, so that I can begin development and testing of the local environment. [2]
- {High Priority} As a user, I want to open the home page and navigate the project list, so that I can see where projects are located. [2]
- {High Priority} As a user, I want to create, view, edit, and delete projects, so that project information is managed. [3]
- {High Priority} As a developer, I want to understand the folder structure without needing a complex framework, so that I can work on the project more easily. [2]

Sprint 2

Goal: Add sprint management under each project

User Stories and Tasks:

- {High Priority} As a user, I want to create, view, edit, and delete sprints inside a project, so that I organize work into a smaller development cycle. [3]
- {High Priority} As a user, I want to mark a sprint as completed or reopen it if needed, so that I can keep the sprint status accurate from the project changing through time. [3]

- {High Priority} As a user, I want to see simple sprint progress, including total tasks, To Do, In Progress, Done, percent complete, so that I can see the amount of work that is completed and still needs to be done. [5]
- {High Priority} As a user, I want to see whether a project has active or completed sprints, so that I can get the current status of the project without having to open every sprint up. [3]

Sprint 3

Goal: Build the core task tracking workflow.

User Stories and Tasks:

- {High Priority} As a user, I want to create tasks inside a sprint, so that sprint work can be broken down. [3]
- {High Priority} As a user, I want to edit task title, description, status, priority, assignee, and due date, so that details of tasks can remain accurate. [3]
- {High Priority} As a user, I want to delete tasks, so that I can remove tasks that are not needed. [2]
- {High Priority} As a user, I want to move a task between To Do, In progress, and Done, so that task progress is tracked. [3]
- {Medium Priority} As a user, I want to view tasks grouped into simple status columns, so that I can more quickly see that needs to be started, continued, or what is already complete. [2]
- {Medium Priority} As a user, I want to filter tasks by assignee, priority, or status, so that certain tasks are more easily found. [3]

Sprint 4

Goal: Make the app stable, presentable, and ready for final review

User Stories and Tasks:

- {High Priority} As a user, I want to view a sprint report before showing sprint goal, dates, progress, completed tasks, incomplete tasks, and recent activity, so that sprint status can be understood. [5]
- {Medium Priority} As a user, I want to see helpful empty states when there are no projects, sprints, or tasks yet, so that I can see what needs to be done next. [3]
- {High Priority} As a user, I want to receive simple confirmation messages after creating, updating, and deleting actions, so that I can know that my action was successfully seen by the app. [2]
- {Medium Priority} As a developer, I want to run the test suite and verify the main workflow still works, so that I can find any and get rid of bugs. [3]
- {High Priority} As a team, we want to demo the app without relying on outside services, so that we know that the project does not fail because of any service or internet issues. [2]
- {Medium Priority} As a user, I want clear and consistent navigation throughout the application so that I can find important features quickly without feeling overwhelmed. [3]
- {Medium Priority} As a user, I want each task to have a required story-point estimate so that the team can compare the task complexity, plan its workload, and prioritize work effectively. [2]

- {Medium Priority} As a user, I want to view a cumulative project burnup chart based on story points across all sprints so that I can compare completed work with total project scope and understand the team's progress over time. [5]
- {Medium Priority} As a user, I want to expand a project and view its tasks grouped and labeled by sprint directly from the Projects page so that I can review the project's work without opening every sprint individually. [3]
- {Medium Priority} As a user, I was to format project descriptions, sprint goals, and task descriptions using Markdown, so that important information and other details can be clear for the team to read

Sanity Check

The total number of story points for each sprint is:

Sprint 1: 9 points

Sprint 2: 14 points

Sprint 3: 16 points

Sprint 4: 15 points

So, the total number of story points is about 54 stories which is a good amount as each sprint focuses on a small number of tasks which are each relatively simple.

Additionally, as most of the members of the team have some experience with developing with HTML, CSS, Javascript and SQLite, it will make it more possible to finish within the scope of this release.

Product Backlog

High Priority: Project management, sprint management, task management, sprint progress dashboard, SQLite database. [34]

Medium Priority: UI improvements, input validation, additional testing. [13]

Future: User authentication, real-time collaboration, drag-and-drop support, exportable reports. [21]
