

Release Summary

Product Name: TaskFlask

Team Name: The Goatz

Date: July 10, 2026

Key User Stories:

1. As a developer, I want to clone the repo, install dependencies, initialize the database, and run the app locally, so that I can begin development and testing of the local environment. [2]

Acceptance Criteria: A developer can clone the repository, install all dependencies from requirements.txt, initialize the SQLite database using the documented Flask command, start the application locally, and access it without errors.

2. As a user, I want to create, view, edit, and delete sprints inside a project, so that I organize work into a smaller development cycle. [3]

Acceptance Criteria: A user can create, open, edit, and delete sprints within a selected project, and all changes are saved and displayed correctly.

3. As a user, I want to see simple sprint progress, including total tasks, To Do, In Progress, Done, percent complete, so that I can see the amount of work that is completed and still needs to be done. [5]

Acceptance Criteria: The sprint page displays accurate totals for all tasks, To Do, In Progress, and Done, along with a completion percentage calculated from completed story points over total story points.

4. As a user, I want to create tasks inside a sprint, so that sprint work can be broken down. [3]

Acceptance Criteria: A user can create a task within a sprint by entering all required information, and the saved task appears in the correct status column on the sprint board.

5. As a user, I want to move a task between To Do, In progress, and Done, so that task progress is tracked. [3]

Acceptance Criteria: A user can drag a task between the To Do, In Progress, and Done columns, and the updated status and card order remain correct after refreshing the page.

6. As a user, I want to view a sprint report before showing sprint goal, dates, progress, completed tasks, incomplete tasks, and recent activity, so that sprint status can be understood. [5]

Acceptance Criteria: The sprint report displays the sprint goal, start and end dates, story-point progress, completed tasks, incomplete tasks, and recent activity using accurate sprint data.

7. As a team, we want to demo the app without relying on outside services, so that we know that the project does not fail because of any service or internet issues. [2]

Acceptance Criteria: The application can be installed, started, and demonstrated locally with SQLite without requiring internet access, cloud hosting, OAuth, or another external service.

8. As a user, I want each task to have a required story-point estimate so that the team can compare the task complexity, plan its workload, and prioritize work effectively. [2]

Acceptance Criteria: Every task must have a positive whole-number story-point estimate before it can be saved, and that estimate is displayed with the task and included in progress and burnup calculations.

Know Problems:

- The sprint report described in the release plan is not included in the final release; sprint goals, dates, progress, and tasks must be reviewed in the application.
- The application has no user accounts, authentication, project roles, or permissions where assignees are stored as free-form text.
- The project burnup reconstructs history from editable task added and completion dates rather than from an immutable event history.

Product Backlog:

- As a user, I want downloadable sprints project reports containing goals, dates, progress, completed and incomplete work, and recent activity, so that I can keep a personal record of the project. [5]
- As a user, I want immutable scope and the completion history, so that burnup data stays accurate even after tasks are edited. [5]
- As a user, I would like to have project members, search and advanced filtering, so that a lot of projects being present become easier to manage.
